We may count off beats of a pulse as the ball rolls down the track: "one ... two ... three ... four ... five ... six ... seven ... eight ..." We ask a friend to make a small mark at the location of the ball at each count; we can then measure the distance the ball travelled from the point of release in one, or two, or three, etc., equal intervals of time. Galileo expressed the result of his observations in this way: if the location of the ball is marked at 1, 2, 3, 4, ... units of time from the instant of its release.

Its units are  $M^{-1}\cdot s^{-1}$ . This rate constant has an upper limit due to the fact that the two molecules must collide before binding. For two molecules moving in solution (free diffusion), the maximum value of  $K_{on}$  is about  $1 \times 10^9 M^{-1}\cdot s^{-1}$  [4].  $K_{off}$  is the first-order rate constant for the dissociation of the protein-ligand complex. The dimension of  $K_{off}$  is  $time^{-1}$ .  $K_d$  is the equilibrium constant for the dissociation equilibrium, it is equal to  $K_{on}/K_{off}$ , and its units are M. It should not be confused with.

4 Feb 2014 . The properties of CaNb<sub>2</sub>O<sub>6</sub> nanoparticles synthesized by coprecipitation method under controlled reaction rate and extended calcination time were studied. Analysis of the X-ray diffraction pattern shows single orthorhombic phase of the material with lattice parameters: Å, Å, and Å. The morphology and size of particles was found to be improved due to the controlled reaction rate and extended calcination time. The average sizes of the particles were estimated as 40.

Influences of assessment on the volume, focus and quality of studying. Condition 1. Sufficient assessed tasks are provided for students to capture sufficient study time.
